What Is Soma?

Soma (Carisoprodol) is a prescription muscle relaxer used to relieve acute muscle pain, stiffness, and discomfort. It works by calming the communication between nerves and the brain, helping the body relax.

How Soma Works in the Body

Soma does **not** directly relax muscles. Instead, it works on the **central nervous system (CNS)** to reduce pain signals.

Once taken, the liver converts Soma into **meprobamate**, a compound with **sedative and anxiety-relieving effects**, which enhances relaxation.

Why Doctors Prescribe Soma

Doctors usually prescribe Soma for:

- Sudden **muscle injuries**
 - **Back pain**, sprains, and strains
 - **Muscle tension** from physical stress
 - Recovery after physical trauma
It is meant for **short-term use (2–3 weeks)** because of dependence risks.
